SKIN CANCER

Skin Cancer is the most common of all cancers. More than 3.5 million cases of Basal and Squamous Cell Skin Cancer are diagnosed in the United States each year. A more serious type of skin cancer, Melanoma accounted for 76,600 cases last year. Basal and Squamous cell cancers which are very common and very treatable are most often found in sun-exposed areas of the skin such as the head, neck and arms.

SOFT RADIATION THERAPY (SKIN TREATMENT)

Our Sensus® Therapy Unit is the first facility in the State of Colorado to install state-of-the-art equipment that offers skin cancer patients with a new, non-invasive, non-Moh’s, non-surgical option to curatively treat basal cell carcinoma or squamous cell carcinoma of the skin. This new modality is especially useful and effective for head, neck and face skin cancers because there are no surgical scars (no scalpels and no needles) as a result of treatment or needed for treatment. This treatment, called SRT or “soft radiation treatment,” is effectively limited to the thickness of the skin and focused directly to the cancerous spot(s). Treatment can be administered in as little as two days per week for 8 treatments total and is 95% — 98% effective. The actual treatment sessions last a minute or less.

While the national skin cancer diagnosis rate is annually estimated to be 2.5 times greater than all other cancers, there are between 10% and 20% of these patients with pre-existing conditions that are not conducive to an invasive procedure. Many patients who have had one or more Moh’s surgeries may prefer a non-surgical option.
